

# How to Guide ELS31 and Linux

Craig Mowder - Technical Sales Engineer NAFTA  
September 2017

## Connecting ELS31

- ✦ To connect your ELS31 to your computer, please see:
  - ✦ Getting started guide “`e1s31_startup_guide_v02.pdf`”
- ✦ This tutorial will use the ELS31 USB cable and default settings
  - ✦ See USB guide  
“`e1s31_an39_usb_interface_v01.pdf`”
  - ✦ 1x Linux Ethernet Network adapters will appear, only 1 used
  - ✦ 5x Linux ttyACM ports will also be created
- ✦ Linux will allocate ports starting at the lowest available
  - ✦ For example assigning the ELS31 typically ttyACM0
  - ✦ If ACM0 is already taken, ELS31 will take ttyACM1
- ✦ Port usage is as follows:
  - ✦ 1x AT command port over ttyACM (Typically ACM0)
  - ✦ 1x USB Modem port over CDC ECM

# Linux Configuration

- ✧ All commands will be issued on the Linux command line
- ✧ You can check the interface allocations from the terminal using:
  - ✧ `ls /dev/ttyACM*`
- ✧ You can configure the interfaces for cellular coms using one of the following terminals:
  - ✧ Minicom `sudo apt-get install minicom`
  - ✧ Cutecom `sudo apt-get install cutecom`
  - ✧ Microcom `sudo apt-get install microcom`

# Terminal Communication

✦ You can use any of the above terminal programs, but most of us use Cputecom

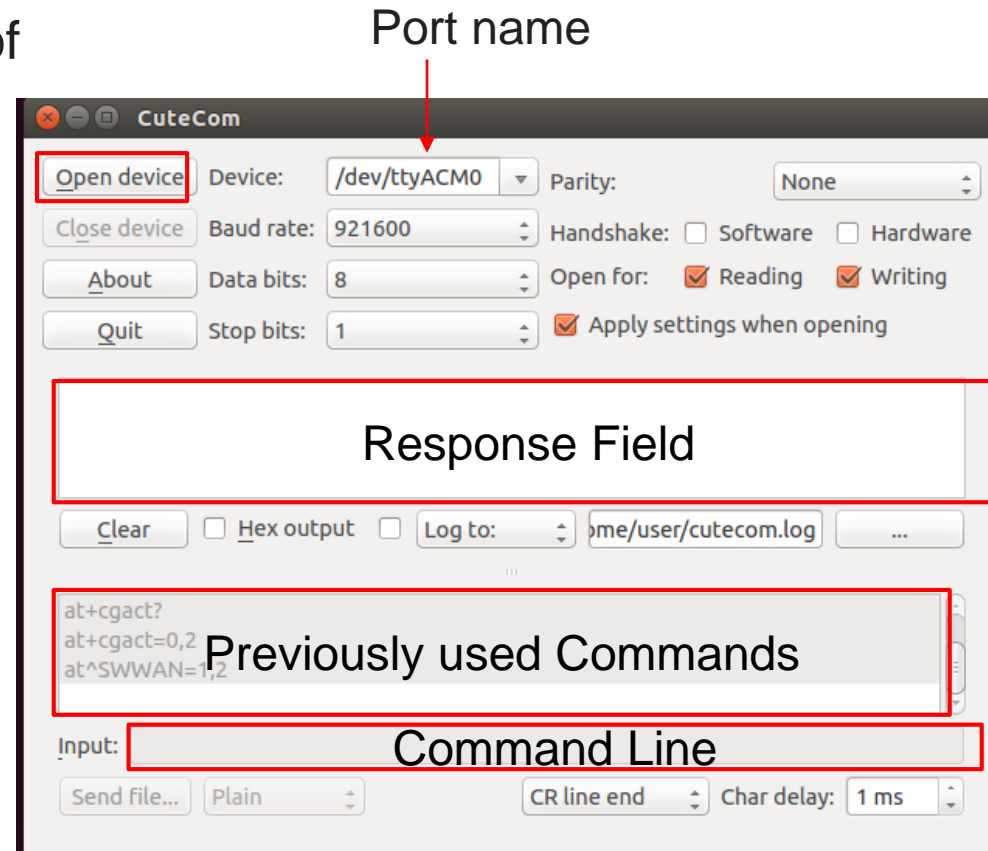

✦ Initialize your terminal

✦ \$ `cutecom`

✦ Select the AT Communication port

✦ `/dev/ttyACM0` in this example

✦ Click “Open device”

# Module Configuration

- ✦ ALL you need to do now is set the APNs and off you go!
- ✦ Set your module to use the SIM card's APN
  - ✦ AT+CGDCONT=3,"IP","VZWINTERNET"
    - ✦ This value should be the default value
    - ✦ Other APNs can be used as well
- ✦ Start the internet connection
  - ✦ AT+CGACT=1,3

# Common Errors

- ✘ Is the device in full functionality mode:
  - ✘ Check *AT+CFUN?*
  - ✘ Response should begin with “1”
  
- ✘ Has the device registered to the network:
  - ✘ Check *AT+CEREG?*
  - ✘ Response should be “x,1” if on home network or “x,5” if roaming
  - ✘ Other responses indicate the unit is not registered
  
- ✘ Is the SIM communicating?
  - ✘ Check *AT+CPIN?* and then *AT+CIMI*
  - ✘ Response should be “Ready”
  - ✘ Check *AT+COPS?*
  - ✘ Response should begin with “0”
  - ✘ Errors indicate SIM communication issue
  
- ✘ Is the SIM active
  - ✘ Confirm SIM status with network operator

```
AT+CFUN?  
+CFUN: 1,0
```

```
OK
```

```
AT+CEREG?  
+CEREG: 0,1
```

```
OK
```

```
AT+CIMI  
XXXXXXXXXXXXXXXXXXXX
```

```
OK
```

```
AT+CPIN?  
+CPIN: READY
```

```
OK
```

```
AT+COPS?  
+COPS: 0,0,"Verizon",7
```

```
OK
```
